

Sophia

Noah

Lilly

Lilly is the youngest of the Hoffman children. She was born with a rare genetic condition Congenital Hyperinsulinism (HI). HI causes her to have constant low blood sugars. This leads to feeding difficulties, developmental delays and possible seizures or death with out proper management. After her diagnosis, her older sister Sophia was diagnosed with Hyperinsulinism and Ketotic Hypoglycemia. Noah was also diagnosed with Ketotic Hypoglycemia and protein induced Hyperinsulism. All siblings have ABCC8 gene mutation.

Each day brings a new challenge of making sure that each of the Hoffman siblings have good blood sugars and snacks. Even with treatment plans in place, their blood sugars are not regulated with out close monitoring.

*A Disease May Be RARE but HOPE Should Not Be*
